DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-36 are rejected under 35 U.S.C. 102(b) as being anticipated by Saito et al. The inventive concept and structure of the claimed invention describes a memory device comprising a ferroelectric element which can store two or more bits of data by means of multiple polarization states. The Saito reference also teaches such a memory device, for example, utilizing a ferroelectric capacitor, where a single ferroelectric capacitor may have a plurality of stable polarization states, thereby storing two or more bits of information, as claimed. See, for example, the discussion in Saito at col. 18, l. 62 through col. 19, l. 15.

Saito also teaches that the different polarization states may be achieved by applying an electric field at various angles to the ferroelectric capacitor, as discussed at col. 26, l. 13-23. Furthermore, as shown in Fig. 21 of Saito, a plurality of stabilized states may be achieved in a single capacitor. Since Saito also uses either a ABO_3 or $Ab_xC_{(1-x)}O_3$ ferroelectric material, these different states would inherently result from the repositioning of the B or C atoms, as claimed.

Saito also teaches the formation of a ferroelectric element having a plurality of electrodes (Figs. 4 and 10) where the electrodes are connected to a data readout line via a transistor.

Finally, Saito teaches the use of the same ferroelectric materials as claimed.
